We report a retrospective review of 12 encephaloceles (6 type 1 and 6 type 2) diagnosed after birth in 11 patients from 1995 to 2009. Encephaloceles were classified as type 1 (5) or type 2 (7) according to their communication with the anterior cranial fossa. Median age at diagnosis was 5 weeks. Eight patients were born after 40 weeks' gestation and five after 37 weeks'. Mean gestational age was 37 weeks (range 31-40 weeks). Obstetrical history, maternal nutritional status, the presence of polyhydramnios and the mother's body mass index before pregnancy were not significantly different between the groups. The mean birth weight of the children with type 1 encephaloceles was 2.7 kg (range 1.5-3.6) and the 5 type 2 encephaloceles were 2.4 kg (range 1.5-2.6). In 8/12 encephaloceles, polyhydramnios was present. The encephaloceles were detected by prenatal ultrasound in 5/12 cases. At operation the defect was closed in 10/12 cases. Mean follow up time was 4 years (range 3-8). We recorded no cases of hydrocephalus or endocranial infection. Encephaloceles diagnosed after birth show different characteristics and natural history in comparison with those of encephaloceles diagnosed prenatally. We suggest that birth weight be considered a risk factor in diagnosing encephaloceles detected after birth. 1. Field of the Invention The present invention relates generally to control and supervision of an aircraft operation using a distributed control system. More particularly, the invention relates 82157476af
